Expected value per hand (bb)

Highest EV: AA +5.83 KK +4.98 QQ +4.49 JJ +4.03 AKs +3.61 TT +3.6 AKo +3.41 AQs +3.23

Barely +EV (near-indifferent): 96s +0.01 Q7s +0.02 K9o +0.02 65s +0.05

Looks playable, quietly loses: K4s -0.02 J9o -0.02 75s -0.03 T6s -0.06 Q9o -0.07 98o -0.07 K3s -0.08

54s -0.08

Fifteen blinds is where most good players stop shoving and start raising. That does not make this chart obsolete — it makes it a benchmark. Any hand that is a clearly profitable jam at 15bb is a hand strong enough to get all the money in preflop; anything below that line should be raised with a plan, not shoved out of laziness.

The ranges have compressed hard from 8bb: the button is down from 47% to 36%, the small blind from 76% to 61%, and UTG has almost bottomed out at 10%. Notice which hands survive at every stack — pairs and big suited aces — and which vanish first: the offsuit gappers and weak suited kings that only ever worked because someone had to fold.

A word on ICM: all of these numbers are pure chip EV. On a final-table bubble, a 15bb shove that is +0.05bb in chips can be clearly losing in real money, because busting costs you more than the chips are worth. Use these ranges as the chip-EV baseline and tighten from there whenever pay jumps are close.
